

## Sprint planning 2

During the second scrum-meeting we kept working on our unfinished previous tasks and also added a few more. This led ut to the following tasks::

1. Making mock up for CTHMaps Android
2. Implementing dummy GUI in eclipse
3. Implementing GPS
4. Adding GPS-marker for current position
5. Databases
6. IndoorsGUI with swipe-function
7. Create building-icons with links to indoor-view

As happened last week we decided that Tomas should continue with making mockups and everybody should continue impementing dummy-GUI.

Anton took the GPS-tasks, that is, to implement the GPS in the app, and make the users position visible on the map-view.

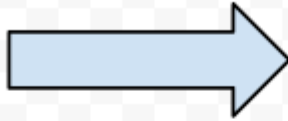

Tomas took the database-task, that is setting up the database responsible for storing the coordinates for our buildings.

Henrik started working on the indoorsGUI-view with the swipe-function to choose between different floors. Ha also started with the task concerning the building-icons and their links to the indoor-view.

See sprint 2 for hour-estimation.
